

## Container

Used to hold row and columns. You can create 12 columns and unlimited rows.

*Type of container*

1. Fixed container ( centre of screen)

```
<div class="container"></div>
```

2. Fluid container (full width of screen)

```
<div class="container-fluid"></div>
```

## Row

You can have unlimited row in a page

```
<div class="container">  
    <div class="row">  
        <p></p>  
    </div>  
  
    <div class="row">  
        <p></p>  
    </div>  
  
</div>
```

## Columns

You can have maximum 12 Columns in a row

```
<div class="col-*-*"></div>
```

The first \* is for size

xs for phone  
sm for tablet  
md for desktop  
lg for large desktop

The second \* is for number of columns ( 1 - 12)

Example if you want to make container for desktop and divide the column  
In 4, then

```

<div class="container">
  <div class="row">
    <div class="col-md-4">
      <p></p>
    </div>
  </div>
</div>

```

Smaller the col size means smaller the width of div. Mean col-md-1 has the smallest width and col-md-12 will have the largest width

The sum of col in a single row must not pass 12

Example

```

<div class="row">
  <div class="col-md-4">
    <p></p>
  </div>
  <div class="col-md-6">
    <p></p>
  </div>
  <div class="col-md-2">
    <p></p>
  </div>
</div>

```
